Responsible Persons: Researcher with Modul 1 after registration on animal license

Method: Injection	
Min/Max amount:	
Maximum injection volume is 10 μl/g mouse = 200 μl/20 g.	

Machine:

Laminar flow/changing station

University of Zurich ^{uzH} Institute of Laboratory Animal Sciences	Standard Operating Procedure SOP	Page 2 of 2		
Date: 03.08.2018 Intraperitoneal injection of mice i.p. Injection		LTK-TRT-10-EN Version: C		
Material: 1. 1 ml syringe/insulin syringe				

2. 26-27 gauge needle, 12 mm length

Safety:

Rules for the respective animal room have to be followed

Method Description:

This method allows the introduction of liquids directly and quickly into the vascular system of the mouse. The recommended needle size for i.p. injections in the mouse is 26-28 gauge. Maximum injection volume is 10 μ l/g mouse = 200 μ l/20 g.

- 1. Place cage with animal and second cage (if more than one mouse is injected) under laminar flow/changing station
- 2. Restrain the mouse very well with one hand, to prevent injury to the mouse while injecting. If possible, also restrain one hind limb.
- 3. Turn the mouse so the ventral side is facing up. Now tilt the mouse so that the head is facing down and the abdomen is nearest to you.
- 4. With the other hand, insert the injection needle at the lower right abdomen, at 30 degrees to the skin, and along the imaginary diagonal line connecting the right hind limb and the left forelimb. Insert about half a centimeter into the abdomen.
- 5. Aspirate a little to check no blood or greenish liquid appears, which would be a sign of needle being inserted into blood vessel or intestines. If any aspirate is seen, stop. (blood observe 5 min, inject contralateral side, any other euthanize)
- 6. If there is no aspirate, proceed with injecting the liquid.
- 7. Withdraw the needle and return the mouse to the second cage. Observe for any signs of distress or trauma.

Criteria for approving outcome:

all liquid injected without complications

Documentation:

The experiment has to be recorded as required by the respective animal permit. Also, an entry in the lab book has to be made.

Problem management:

In case of serious adverse events the animal has be euthanized. Contact supervisor, lab head or vet.
